

**Task 2: Science research should be carried out and controlled by governments rather than private companies. Do you agree or disagree?**

Some people argue that scientific research only can be took by political leaders instead of those who in privately company. While I accept that government is object which participate in this research, I believe that it is not a best way.

On the one hand, there are some reason why to explain to argument that science report is created by government. First, this is process which use much money and time to completing its, require an intensive knowledge. The result of science report is the key to implement many policy which related to solve issues, bring a meaningful about public general. In addition, making science research must accompany with set up ethical standard, especially in health. Another point can see that a few studies related to some issues in which non-governmental person cannot approach, such as military technology, and they must set the higher security to avoid negatively consequence.

On the other hand, I side with those who think that self company or person can contribute to reading up to science report. First, it will help reduce government's funding in a large number of research problem. Thanks to it, government can controll budget and expediture usefully about many major: health, transport,... Besides, getting involve in research projects is the beneficial way which inducing rise their passion for research, enhance knowledge about social of individual. Not only so this is an beneficial method to attract an increasing number of people who own high ability for completing scientific studies. To illustrate, people can see many scientific report of authors about different topic which pushed up on website, journal, such as reseaching of environment, financial, article about astronomy,..., and these authors without belonging to any government agency. So, implement this studies about is the way help them develop themselves.

In conclusion, I totally agree with contention that any organization or anyone can join in scientific research, as long as responsive the of science's target.
